## Alexander Van Roijen

October 16, 2018

Please complete the following:

## 1. Problem 1

(a) Find the mean and the variance of a Discrete Uniform random variable on 1, 2, ...,n. Note that  $\sum_{j=1}^{n} j = \frac{n(n+1)}{2}$  and  $\sum_{j=1}^{n} j^2 = \frac{n(n+1)(2n+1)}{6}$  are well known summations that can be proved via mathematical induction.

Refer to http://mathforum.org/library/drmath/view/56920.html for an example. Let  $X \sim \mathrm{DUnif}$ 

$$P(X = x) = \frac{1}{n}$$
 by the def of uniform distrib (1)

$$E[X] = \sum_{j=1}^{n} P(X=j) * j = \sum_{j=1}^{n} \frac{1}{n} * j = \frac{1}{n} * \sum_{j=1}^{n} j = \frac{1}{n} * \frac{n(n+1)}{2} = \frac{n+1}{2}$$
 (2)

It is a similar proof with a different substitution for the expected value of X squared

(3)

$$E[X^2] = \sum_{j=1}^{n} P(X=j) * (j^2) \text{ LOTUS}$$
 (4)

$$= \sum_{j=1}^{n} \frac{1}{n} * (j^2) = \frac{1}{n} * \sum_{j=1}^{n} (j^2) = \frac{1}{n} * \frac{n(n+1)(2n+1)}{6} = \frac{(n+1)(2n+1)}{6}$$
 (5)

$$E[X^{2}] - (E[X])^{2} = \frac{(n+1)(2n+1)}{6} - (\frac{n+1}{2})^{2}$$
 (6)

$$\frac{4*(n+1)(2n+1)}{24} - \left(\frac{6*(n+1)^2}{24}\right) = \frac{n^2 - 1}{12} \tag{7}$$

(b) Let X be a discrete random variable that satisfies the properties listed in the homework. Find E[X]

We have a symmetry such that 
$$P(X = x) = P(X = -x)$$
 (8)

$$E[X] = \sum_{x=-n}^{n} P(X=x) * x$$
 (9)

$$= P(X = -n) * -n + P(X = -(n-1)) * (-(n-1)) + \dots + P(X = n) * n$$
 (10)

$$= -1 * (P(X = -n) * n - P(X = n) * n) + ...P(X = 0) * 0$$
(11)

$$= -1*(P(X=n)*n - P(X=n)*n) + ...P(X=0)*0 = 0 + 0 + ... + 0$$
 (12)

due to the symmetry of the probs 
$$(13)$$

$$=> E[X] = 0 \tag{14}$$

2. We have X with PMF  $P(X = k) = \frac{-1*p^k}{\log(1-p)*k}$  for k = 1, 2, . . . Here p is a parameter with 0 ; p ; 1. Find the mean and the variance of X

First, note that the value  $\frac{-1}{\log(1-p)}$  is a positive constant

$$E[X] = \sum_{k=1}^{\infty} P(X=k) * k = \sum_{k=1}^{\infty} \frac{-1 * p^k}{\log(1-p) * k} * k = \sum_{k=1}^{\infty} \frac{-1 * p^k}{\log(1-p)}$$
 (15)

$$=\frac{-1}{\log(1-p)}\sum_{k=1}^{\infty}p^k\tag{16}$$

$$= \sum_{x=1}^{\infty} p^k = S = S * p = \sum_{x=2}^{\infty} p^k = S - Sp = p = S = \frac{p}{(1-p)}$$
 (17)

 $=> E[X] = \frac{-1}{\log(1-p)} * \frac{p}{(1-p)}$  similarly, the  $E[X^2]$  is proved in a similar manner except

(18)

$$S - Sp = \sum_{x=1}^{\infty} p^k \tag{19}$$

which we already proved so by substituting we get (20)

$$S - Sp = \frac{p}{(1-p)} \Longrightarrow S = \frac{p}{(1-p)^2} \tag{21}$$

$$=> E[X^2] = \frac{-1}{\log(1-p)} * \frac{p}{(1-p)^2}$$
 (22)

$$=> Var(X) = E[X^{2}] - E[X]^{2} = \frac{p(p - \log(1 - p))}{\log(1 - p)^{2} * (1 - p)^{2}}$$
(23)

3. (a) Use LOTUS to show that for X  $\sim \text{Pois}(\lambda)$  and any function g(.),  $E[Xg(X)] = \lambda E[g(X+1)]$ 

$$E[Xg(X)] = \sum_{x=0}^{\infty} x * g(x) \frac{e^{-\lambda} * \lambda^x}{x!} = \sum_{x=1}^{\infty} g(x) * \lambda \frac{e^{-\lambda} * \lambda^{x-1}}{(x-1)!}$$
(24)

now let there be a substitution such that j = x-1 (25)

$$= \sum_{j=0}^{\infty} g(j+1) * \lambda \frac{e^{-\lambda} * \lambda^j}{j!} = \lambda * \sum_{j=0}^{\infty} g(j+1) \frac{e^{-\lambda} * \lambda^j}{j!}$$
 (26)

We see how we can convert this back to a form we understand using LOTUS (27)

$$E[Xg(X)] = \lambda * E[g(X+1)] \tag{28}$$

(29)

(b) Find the third moment  $E(X^3)$  for X Pois( $\lambda$ )

let 
$$g(x) = x^2 = E(Xg(X)) = \lambda E[g(X+1)] = \lambda * E[(X+1)^2]$$
 (30)

$$= \lambda * E[X^2 + 2X + 1] = \lambda * (E[X^2] + 2E[X] + 1)$$
(31)

using the known properties of the variance and mean of the uniform dist we get

(32)

$$= \lambda * (\lambda^2 + \lambda + 2\lambda + 1) = \lambda^3 + 3\lambda^2 + \lambda \tag{33}$$

4. Show that for any events  $A_1...A_n$ ,  $P(A_1 \cap ... \cap A_n) \ge \sum_{j=1}^n P(A_j) - n + 1$  lets prove this through induction

Base case, 
$$n=1:P(A) \ge P(A) - 1 + 1 => P(A) \ge P(A)$$
 (34)

Now we assume this is true for 
$$1 \dots n$$
, NTS for  $n+1$  (35)

n+1 case: we have 
$$\sum_{j=1}^{n+1} P(A_j) - (n+1) + 1 = \sum_{j=1}^{n} P(A_j) + P(A_{n+1}) - (n+1) + 1 \quad (36)$$

Now notice we can rewrite  $P(A_1 \cap ... \cap A_{n+1}) = P(B \cap A_{n+1})$  where  $B = A_1 \cap ... \cap A_n$ 

(37)

$$=> P(B \cap A_{n+1}) = P(B) + P(A_{n+1}) - P(A_{n+1} \cup B)$$
 by definition (38)

By the induction hypothesis, we know 
$$P(B) \ge \sum_{j=1}^{n} P(A_j) - n + 1$$
 (39)

That means all that is left to show is  $P(A_{n+1}) - P(A_{n+1} \cup B) \ge P(A_{n+1}) - 1$  (40)

$$=> P(A_{n+1}) - P(A_{n+1} \cup B) \ge P(A_{n+1}) - 1 => -P(A_{n+1} \cup B) \ge -1 => P(A_{n+1} \cup B) \le 1$$

$$(41)$$

We know this inequality is true as 
$$0 \le P(X) \le 1$$
 (42)

Thus, we have proved the induction step.  $\Box$  (43)

5. For X  $\sim \operatorname{Pois}(\lambda),$  find  $E[2^X]$  , if it is finite.

$$E[2^X] = \sum_{n=0}^{\infty} \frac{2^n e^{-\lambda} \lambda^n}{n!} = \sum_{n=0}^{\infty} \frac{e^{-\lambda} (2 * \lambda)^n}{n!} = e^{-\lambda} \sum_{n=0}^{\infty} \frac{(2 * \lambda)^n}{n!}$$
(44)

now let 
$$\lambda' = 2 * \lambda = e^{-\lambda} \sum_{n=0}^{\infty} \frac{(\lambda')^n}{n!}$$
 (45)

we recognize this is the taylor expansion of the exponential function (46)

we get 
$$\sum_{n=0}^{\infty} \frac{(\lambda')^n}{n!} = e^{\lambda'} = e^{2\lambda} = E[2^X] = e^{-\lambda}e^{2\lambda} = e^{\lambda} \square$$
 (47)

6. For  $X \sim \text{Geom}(p)$ , find  $E[2^X]$  and  $E[2^{-X}]$  (if it is finite).

$$E[2^X] = \sum_{n=1}^{\infty} 2^n (1-p)^{n-1} * p \ \text{let} S = \sum_{n=1}^{\infty} 2^n (1-p)^{n-1} = 2 + 4(1-p) + \dots$$
 (48)

$$=> S * 2(1-p) = 4(1-p) + 8(1-p)^{2} + \dots => S - S * 2(1-p) = 2$$
 (49)

$$S - 2S + 2Sp = -S + 2Sp = S(-1 + 2p) = 2 \implies S = \frac{2}{2p - 1} \implies E[2^X] = p * S = \frac{2p}{2p - 1}$$
(50)

Similarly 
$$E[2^{-X}] = \sum_{n=1}^{\infty} 2^{-n} (1-p)^{n-1} * p \text{ we let } S = \sum_{n=1}^{\infty} 2^{-n} (1-p)^{n-1} = \sum_{n=1}^{\infty} \frac{(1-p)^{n-1}}{2^n}$$
(51)

$$= \frac{(1-p)^0}{2^1} + \frac{(1-p)^1}{2^2} + \dots = > S * \frac{1-p}{2} = \frac{(1-p)^1}{2^2} + \frac{(1-p)^2}{2^3}$$
 (52)

$$=>S-S*\frac{1-p}{2}=S(1-\frac{1-p}{2})=S*\frac{1+p}{2}=\frac{1}{2}=>S=\frac{1}{1+p} \hspace{1cm} (53)$$

$$=> E[2^{-X}] = \frac{p}{1+p} \square$$
 (54)
